

Imagine

Imagine

Imagine

A pandoc filter that turns fenced codeblocks into graphics or ascii art by wrapping some external command line utilities, such as:

```
actdiag, asy, asymptote, blockdiag, boxes, circo, ctioga2, ditaa, dot,
fdp, figlet, flydraw, gle, gnuplot, graph, graphviz, gri, imagine,
mermaid, mscgen, neato, nwdiag, octave, packetdiag, pic, pic2plot,
plantuml, plot, ploticus, protocol, pyxplot, rackdiag, seqdiag, sfdp,
twopi
```

Installation

1. Put ``imagine.py`` anywhere along `$PATH` (pandoc's search path for filters).
 2. `% sudo pip install (mandatory):`
 - `pandocfilters`
 3. `% sudo apt-get install (1 or more of):`
 - `asymptote`, <http://asymptote.sourceforge.net>
 - `boxes`, <http://boxes.thomasjensen.com>
 - `ctioga2`, <http://ctioga2.sourceforge.net>
 - `ditaa`, <http://ditaa.sourceforge.net>
 - `figlet`, <http://www.figlet.org>
 - `flydraw`, <http://manpages.ubuntu.com/manpages/precise/man1/flydraw.1.html>
 - `gle-graphics`, <http://glx.sourceforge.net>
 - `gnuplot`, <http://www.gnuplot.info>
 - `graphviz`, <http://graphviz.org>
 - `gri`, <http://gri.sourceforge.net>
 - `imagemagick`, <http://www.imagemagick.org> (gri needs this)
 - `plantuml`, <http://plantuml.com>
 - `ploticus`, <http://ploticus.sourceforge.net/doc/welcome.html>
 - `plotutils`, <https://www.gnu.org/software/plotutils>
 - `pyxplot`, <http://pyxplot.org.uk>
- `% sudo pip install:`
- `blockdiag`, <http://blockdiag.com>
 - `phantomjs`, <http://phantomjs.org/> (for mermaid)
- `% git clone`
- `protocol`, <https://github.com/luismartingarcia/protocol.git>
- `% npm install:`
- `-g mermaid`, <https://kns.github.io/mermaid> (and pip install phantomjs)

Pandoc usage

```
% pandoc --filter imagine.py document.md -o document.pdf
```

Markdown usage

	or		or	
<code>```cmd</code>		<code>```{.cmd options="extras"}</code>		<code>```{prog=cmd}</code>
<code>source</code>		<code>source</code>		<code>source</code>
<code>```</code>		<code>```</code>		<code>```</code>
simple		with <code>`options`</code>		with <code>`prog`</code>

Imagine understands/consumes these fenced codeblock key,val-attributes:

- ``options`` used to feed extra arguments to the external command
- ``prog`` used when cmd is not an appropriate document class
- ``keep`` if True, keeps a reconstructed copy of the original CodeBlock

Notes:

- if ``cmd`` is not found, the codeblock is kept as-is.
- input/output filenames are generated from a hash of the fenced codeblock.
- subdir ``pd-images`` is used to store any input/output files
- if an output filename exists, it is not regenerated but simply linked to.
- ``packetdiag`` & ``sfdp``'s underlying libraries seem to have some problems.

How Imagine works

The general format for an external command looks something like:

```
% cmd <options> <inputfile> <outputfile>
```

Input/Output filenames are generated using ``pandocfilters.get_filename4code`` supplying both the codeblock and its attributes as a string for hashing. If the input file doesn't exist it is generated by writing the code in the fenced codeblock. Hence, if you change the code and/or the attributes, new files will result.

Imagine does no clean up so, after a while, you might want to clear the ``pd-images`` subdirectory.

Some commands are Imagine's aliases for system commands. Examples are ``graphviz`` which is an alias for ``dot`` and ``pic`` which is an alias for ``pic2plot``. Mainly because that allows the alias names to be used as a cmd for a fenced codeblock (ie. ````graphviz` to get ````dot`)

Some commands like ``figlet`` or ``boxes`` produce output on stdout. This text is captured and used to replace the code in the fenced code block.

Some commands like ``plot`` interpret the code in the fenced code block as an input filename to convert to some other output format.

If a command fails for some reason, the fenced codeblock is kept as is. In that case, the output produced by Imagine on stderr hopefully provides some usefull info.

Security

Imagine just wraps some commands and provides no checks.

So use it with care and make sure you understand the fenced codeblocks before running it through the filter.

Imagine command

Finally, a quick way to read this help text again, is to include a fenced codeblock in your markdown document as follows:

```
```  
```:image
```

That's it, enjoy!

Noop's

Anonymous CodeBlock

This code block is anonymous and not processed by Imagine.

A Python CodeBlock

```
if processed_by(Imagine):  
    raise Exception('Not ignored by Imagine!')  
else:  
    print "Great, if you're reading this, it passed through Imagine unharmed"
```

Asymptote

[Asymptote](#): The Vector Graphics Language.

Asymptote is a powerful descriptive vector graphics language that provides a natural coordinate-based framework for technical drawing. Labels and equations are typeset with LaTeX, for high-quality PostScript output. A major advantage of Asymptote over other graphics packages is that it is a programming language, as opposed to just a graphics program.

Features of Asymptote:

- provides a portable standard for typesetting mathematical figures, just as TeX/LaTeX has become the standard for typesetting equations;
- generates high-quality PostScript, PDF, SVG, or 3D PRC vector graphics;
- embeds 3D vector PRC graphics within PDF files;
- inspired by MetaPost, with a much cleaner, powerful C++-like programming syntax and IEEE floating-point numerics;
- runs on all major platforms (UNIX, MacOS, Microsoft Windows);
- mathematically oriented (e.g. rotation of vectors by complex multiplication);
- LaTeX typesetting of labels (for document consistency);
- uses simplex method and deferred drawing to solve overall size constraint issues between fixed-sized objects (labels and arrowheads) and objects that should scale with figure size;
- fully generalizes MetaPost path construction algorithms to three dimensions;
- compiles commands into virtual machine code for speed without sacrificing portability;
- high-level graphics commands are implemented in the Asymptote language itself, allowing them to be easily tailored to specific applications.

Notes:

- eps formatted images don't go well together with pandoc.

a plot

```

```{.asy keep="True" caption="Created by Asymptote"}
settings.outformat="png";
settings.prc=false;
settings.render=0;
import three;
size(6cm,0);
draw(0--2X ^^ 0--2Y ^^ 0--2Z);
triple circleCenter = (Y+Z)/sqrt(2) + X;
path3 mycircle = circle(c=circleCenter, r=1, normal=Y+Z);
draw(plane(0=sqrt(2)*Z, 2X, 2*unit(Y-Z)), gray + 0.1cyan);
draw(mycircle, blue);
draw(shift(circleCenter) * (0 -- Y+Z), green, arrow=Arrow3());
```

```

Figure 1: Created by Asymptote

a sphere

```

```{.asy keep="True" caption="Created by Asymptote"}
settings.outformat="png";
settings.prc=false;
settings.render=0;
import graph3;
size(8cm,0);
path3 myarc = rotate(18,Z) * Arc(c=0, normal=X, v1=-Z, v2=Z, n=10);
surface backHemisphere = surface(myarc, angle1=0, angle2=180, c=0, axis=Z, n=10);
surface frontHemisphere = surface(myarc, angle1=180, angle2=360, c=0, axis=Z, n=10);
draw(backHemisphere, surfacepen=material(white+opacity(0.8), ambientpen=white), meshpen=gray(0.4));
draw(0--X, blue+linewidth(1pt));
```

```

Blockdiag

[blockdiag site](#): blockdiag and its family generate diagram images from simple text files:

- Supports many types of diagrams.
 - block diagram (w/ blockdiag)
 - sequence diagram (w/ seqdiag)
 - activity diagram (w/ actdiag)

Figure 2: Created by Asymptote

- logical network diagram (w/ `nwdiag`)
- Generates beautiful diagram images from simple text format (similar to `graphviz`'s DOT format)
- Layouts diagram elements automatically
- Embeds to many documentations; Sphinx, Trac, Redmine and some wikis

blockdiag

```

```{.blockdiag prog="blockdiag" keep="True" width="100%" caption="Created by Blockdiag"}
blockdiag {
// standard node shapes
box [shape = "box"];
roundedbox [shape = "roundedbox"];
diamond [shape = "diamond"];
ellipse [shape = "ellipse"];
note [shape = "note"];

|               (_/
```

Ctioga2

[ctioga2](#) is a powerful command-line based polymorphic plotting program, based on the Tioga plotting library. It produces publication-quality PDF files; you make yourself an opinion of those looking at the gallery. It is a complete rewrite of ctioga. Compatibility was kept when it was not a problem. Most simple graphs from ctioga can be used directly with ctioga2. It benefits from several years of experience writing ctioga, and in particular which mistakes to avoid. It features an original polymorphic interface, which can be driven either using directly the command-line or through command-files. Why yet another plotting program ?

But I wanted something: fast: plotting a data file is done within one or two seconds, just run something like `ctioga2 -X data.dat` from a terminal beautiful: it is based on Tioga, that produces high-quality PDF files powerful:

ctioga2 offers many features that are not found on other plotting systems (at least not all at once), such as

- gradients for successive curves,
- color maps and countours,
- nice filled curves...

Have a look at the gallery.

- equation-friendly: plotting programs offer surprisingly little facilities to typeset equations onto a graph. ctioga2 uses LaTeX — you can't get any better
- scriptable: being a command-line utility, it integrates naturally into the power of command-line scripting.
- It is very easy to animate graphs into a movie !

Parabolas, filling & intersection

```
```{.ctioga2 keep="true" caption="Created by ctioga2" width="60%"}
title "Intersection of two parabolas"

next-inset grid:next
plot 0.1*x**3
end
...

```

## plotting data

The data file's name `../dta/cr2-ex01.dat` is relative to the saved fenced code block in pd-images. Hence the `../dta` part.

```

```{.ctioga2 keep="true" caption="Created by ctioga2" width="60%"}
draw-line -15,0 15,0 /style=Dashes /color=Gray
plot ../dta/ct2-ex01.dat
plot ../dta/ct2-ex01.dat@1:3
title '\centering This is a very long title about sine waves' \
/text-width=5cm /shift=1.3
xlabel 'My $x$ label'
ylabel 'My $y$ label'
plot ../dta/ct2-ex01.dat@'$1:$2*0.5'
plot ../dta/ct2-ex01.dat@'$1:0.5*($2-$3)'
...

```

Figure 9: Created by ctioga2

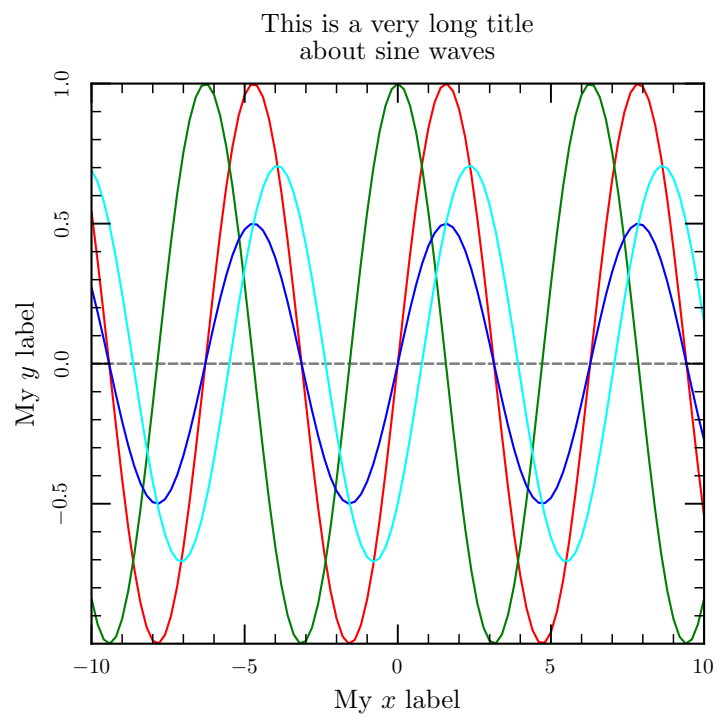

Figure 10: Created by ctioga2

Ditaa

[ditaa site](#): **ditaa** is a small command-line utility written in Java, that can convert diagrams drawn using ascii art ('drawings' that contain characters that resemble lines like | / -), into proper bitmap graphics. This is best illustrated by the following example – which also illustrates the benefits of using ditaa in comparison to other methods :)

ditaa interprets ascci art as a series of open and closed shapes, but it also uses special markup syntax to increase the possibilities of shapes and symbols that can be rendered.

ditaa is open source and free software (free as in free speech), since it is released under the GPL license.

Flydraw

[flydraw](#) is an inline drawing tool that really only produces GIF images despite the claim in the manpage for producing png images. Flydraw reads it's script from stdin and by *not* using the output `<filename.ext>` command, it will produce the image data on it's stdout. This output is captured, saved and linked to.

GLE

GLE (Graphics Layout Engine) is a graphics scripting language designed for creating publication quality figures (e.g., a chart, plot, graph, or diagram). It supports various chart types (including function plot, histogram, bar chart, scatter plot, contour plot, color map, and surface plot) through a simple but flexible set of graphing commands. More complex output can be created by relying on GLE's scripting language, which is full featured with subroutines, variables, and logic control. GLE relies on LaTeX for text output and supports mathematical formulae in graphs and figures. GLE's output formats include EPS, PS, PDF, JPEG, and PNG. GLE is licenced under the BSD license. QGLE, the GLE user interface, is licenced under the GPL license.

GnuPlot

[gnuplot](#) Gnuplot is a portable command-line driven graphing utility for Linux, OS/2, MS Windows, OSX, VMS, and many other platforms. The source code is copyrighted but freely distributed (i.e., you don't have to pay for it). It was originally created to allow scientists and students to visualize mathematical functions and data interactively, but has grown to support many non-interactive uses such as web scripting. It is also used as a plotting engine by third-party applications like Octave. Gnuplot has been supported and under active development since 1986.

Note:

- Imagine catches gnuplot's output on stdout and saves it to an output file. So don't `set output <name>` or Imagine will get confused and die miserably.

Line

Graphviz

[graphviz.org site](http://graphviz.org): Graphviz is open source graph visualization software. Graph visualization is a way of representing structural information as diagrams of abstract graphs and networks. It has important applications in networking, bioinformatics, software engineering, database and web design, machine learning, and in visual interfaces for other technical domains.

Graphviz defaults to dot

```

```{.prog="dot" options="-Gsize=4,1.5" caption="FSM layout by dot" keep="True"}

```

```

digraph finite_state_machine {
 rankdir=LR;
 size="6,3"
 node [shape = doublecircle]; LR_0 LR_3 LR_4 LR_8;
 node [shape = circle];
 LR_0 -> LR_2 [label = "SS(B)"];
 LR_0 -> LR_1 [label = "SS(S)"];
 LR_1 -> LR_3 [label = "S($end)"];
 LR_2 -> LR_6 [label = "SS(b)"];
 LR_2 -> LR_5 [label = "SS(a)"];
 LR_2 -> LR_4 [label = "S(A)"];
 LR_5 -> LR_7 [label = "S(b)"];
 LR_5 -> LR_5 [label = "S(a)"];
 LR_6 -> LR_6 [label = "S(b)"];
 LR_6 -> LR_5 [label = "S(a)"];
 LR_7 -> LR_8 [label = "S(b)"];
 LR_7 -> LR_5 [label = "S(a)"];
 LR_8 -> LR_6 [label = "S(b)"];
 LR_8 -> LR_5 [label = "S(a)"];
}

```

...

sleep -- swap;
swap -- runswap;
runswap -- new;
runswap -- runmem;
new -- runmem;
sleep -- runmem;
}
...
```

Figure 28: created by circo

## GRI

[GRI](#) is a language for scientific graphics programming. The word “language” is important: Gri is command-driven, not point/click.

Some users liken Gri to LaTeX, since both provide extensive power in exchange for patience in learning syntax.

Gri can make x-y graphs, contour graphs, and image graphs, in PostScript and (someday) SVG formats. Control is provided over all aspects of drawing, e.g. line widths, colors, and fonts. A TeX-like syntax provides common mathematical symbols.

### Single plot

With the following in `gri-01.dat`

```
1 8 11 9
2 22 21 20
```

```
3 11 10 9
4 20 15 10
```

plot the first two columns like so:

```
```{.gri keep="true" caption="Created by Gri"}
open dta/gri-01.dat
read columns x y
draw curve
draw title "http://gri.sf.net"
```
```

Figure 29: Created by Gri

## Multiple curves

```
```{.gri keep="true" caption="Created by Gri"}
`draw curves' \xname \y1name ...``
```

Draw multiple y columns versus an x column. Assumes that the datafile is open, and that x is in the first column, with the y values in one or more following columns.

The number of columns is figured out from the options,
as is the name of the x-axis, and the labels to be
used on each of the y curves.

```
{
  # NB. the 3 below lets us skip the words 'draw'
  # and 'curves', and the name of the x-column.
  .num_of_y_columns. = {rpn wordc 3 -}
  if {rpn .num_of_y_columns. 1 >}
    show "ERROR: 'draw curves' needs at least 1 y column!"
    quit
  end if

  set x name {rpn 2 wordv}
  set y name ""

  # Loop through the columns.
  .col. = 0
  while {rpn .num_of_y_columns. .col. <}
    # The x-values will be in column 1, with y-values
    # in columns 2, 3, ..., of the file.
    .ycol. = {rpn .col. 2 +}
    rewind
    read columns x=1 y=.ycol.
    # At this point, you may want to change line thickness,
    # thickness, color, dash-type, etc. For illustration,
    # let's set dash type to the column number.
    set dash .col.
    draw curve
    draw label for last curve {rpn .col. 3 + wordv}
    .col. += 1
  end while
}

open dta/gri-01.dat
draw curves time y1 y2 y3 y4

Mscgen

[mscgen site](#): mscgen is a small program that parses Message Sequence Chart descriptions and produces PNG, SVG, EPS or server side image maps (ismaps) as the output. Message Sequence Charts (MSCs) are

a way of representing entities and interactions over some time period and are often used in combination with SDL. MSCs are popular in Telecoms to specify how protocols operate although MSCs need not be complicated to create or use. Mscgen aims to provide a simple text language that is clear to create, edit and understand, which can also be transformed into common image formats for display or printing.

example w/ boxes

Octave

Hints for using Octave as batch processor:

- `;` makes statements silent
- `figure(1, "visibility", "off")` prevents pop-up window
- `print(1, argv(){1});` prints to intended output filename
- octave will infer image type from output filename extension
- `imagine` calls `octave --no-gui -q <options> <infile> <outfile>`, where
 - `<options>` come from `options="."` in the fenced code blocks attributes
 - `<infile>` is `pd-images/hashed-name.octave` containing the code text
 - `<outfile>` is `pd-images/hashed-name.png` by default

Sinus plot

```
outname = argv(){1}  
figure(1, 'visible', 'off');  
print("%s", fail-here);  
  
x = 0:0.01:2*pi;  
a = sin(x);  
b = cos(2*x);  
c = sin(4*x);  
d = 2*sin(3*x);  
plot(x,a,x,b,x,c,x,d, "linewidth", 2);  
set(gca, "xlim", [0,2*pi], "fontsize", 15);  
title("sinusoids");  
  
print(1, outname, '-dpng');
```

## Ploticus

### Ploticus

Ploticus is a free GPL software utility that can produce various types of plots and graphs like shown here and here. Data input is usually csv files or text files such as used with sort, awk, etc. Output options are GIF, PNG, PostScript, SVG and some others. HTML imagemaps are supported. Ploticus can produce just-in-time plots in dynamic web content systems, or in batch production settings. It can be invoked from your command line, in shell scripts, via system() calls in web content environments and other programs, or via the libploticus API.

### prefab

Ploticus scripts are pretty verbose, it also has a **prefab** method of quickly creating a graphic from a data-file, but that is not supported at the moment.

### Curves script

```

## Plotutils

[plotutils site](#) It includes:

- GNU *graph*, which plots 2-D datasets or data streams in real time. Being designed for command-line use, it can be used in shell scripts. It produces output on an X Window System display, in SVG format, in PNG format, in PNM format, in pseudo-GIF format, in WebCGM format, in Illustrator format, in Postscript format, in PCL 5 format, in HP-GL/2 format, in Fig format (editable with the xfig drawing editor), in ReGIS format, in Tektronix format, or in GNU Metafile format. Output in Postscript format may be edited with the idraw drawing editor. idraw is available in the ivtools package from Vectaport, Inc. Both xfig and idraw are free software.
- GNU *plot*, which translates GNU Metafile format to any of the other formats.
- GNU *tek2plot*, for translating legacy Tektronix data to any of the above formats.
- GNU *pic2plot*, for translating the pic language (a scripting language for designing box-and-arrow diagrams) to any of the above formats. The pic language was designed at Bell Labs as an enhancement to the troff text formatter.
- GNU *plotfont*, for displaying character maps of the fonts that are available in the above formats.
- GNU *spline*, which does spline interpolation of data. It normally uses either cubic spline interpolation or exponential splines in tension, but it can function as a real-time filter under some circumstances.
- GNU *ode*, which numerically integrates a system consisting of one or more ordinary differential equations.

We developed these command-line programs to replace the Unix command-line programs graph, plot, and spline. The GNU versions are far more powerful, and are free software.

Note:

- Imagine only wraps plot and pic2plot (pic is an alias for pic2plot).

### graph

Each invocation of [graph](#) reads one or more datasets from files named on the command line or from standard input, and prepares a plot. There are many command-line options for adjusting the visual appearance of the plot. The following sections explain how to use the most frequently used options, by giving examples.

```
```.graph options="-X x-axis -Y y-axis -f 0.1 --bitmap-size 200x200" keep="True" caption="PlotUtil's g
0.0  0.0
1.0  0.2
2.0  0.0
3.0  0.4
4.0  0.2
5.0  0.6
```.
```

### plot

The GNU *plot* filter displays GNU graphics metafiles or translates them to other formats. It will take input from files specified on the command line or from standard input. The ‘-T’ option is used to specify the desired output format. Supported output formats include “X”, “png”, “pnm”, “gif”, “svg”, “ai”, “ps”, “cgm”, “fig”, “pcl”, “hpgl”, “regis”, “tek”, and “meta” (the default).

The metafile format is a device-independent format for storage of vector graphics. By default, it is a binary rather than a human-readable format (see Metafiles). Each of the graph, pic2plot, tek2plot, and plotfont utilities will write a graphics metafile to standard output if no ‘-T’ option is specified on its command line. The GNU libplot graphics library may also be used to produce metafiles. Metafiles may contain arbitrarily many pages of graphics, but each metafile produced by graph contains only a single page.

Figure 43: PlotUtil's graph

`plot`, like the metafile format itself, is useful if you wish to preserve a vector graphics file, and display or edit it with more than one drawing editor.

```
```{.plot options="--bitmap-size 300x200" keep="True" caption="Created by plot"}  
dta/input.meta  
```
```

Figure 44: Created by plot

## pic2plot

*From the gnu website:*

The [pic language](#) is a ‘little language’ that was developed at Bell Laboratories for creating box-and-arrow diagrams of the kind frequently found in technical papers and textbooks. A directory containing documentation on the pic language is distributed along with the plotting utilities. On most systems it is installed as `/usr/share/pic2plot` or `/usr/local/share/pic2plot`. The directory includes Brian Kernighan’s original technical report on the language, Eric S. Raymond’s [tutorial](#) on the GNU implementation, and some sample pic macros contributed by the late W. Richard Stevens.

## Protocol

[protocol github](#): Protocol is a simple command-line tool that serves two purposes:

- Provide a simple way for engineers to have a look at standard network protocol headers, directly from the command-line, without having to google for the relevant RFC or for ugly header image diagrams.
- Provide a way for researchers and engineers to quickly generate ASCII RFC-like header diagrams for their own custom protocols.

## TCP Header

```

```{.protocol keep="True" caption="protocol"}

```

```
tcp
```

```

```

 0 1 2 3
 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
| Source Port | Destination Port |
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
| Sequence Number |
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
| Acknowledgment Number |
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
| Offset| Res. | Flags | Window |
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
| Checksum | Urgent Pointer |
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
| Options | Padding |
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+

```

and even custom layouts:

## Customer packet

```

```{.protocol options="--no-numbers" keep="True" caption="protocol"}
Source:16,TTL:8,Reserved:40
```

```

```

+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
| Source | TTL |
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+
| Reserved |
+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+

```

## PyxPlot

### ex01

```

```{.pyxplot keep="True" caption="Created by PyxPlot"}
set numerics complex
set xlabel r"$x$"
set ylabel r"$y$"
set zlabel r"$z$"
set xformat r"%s$\pi$"%(x/pi)
set yformat r"%s$\pi$"%(y/pi)
set xtics 3*pi ; set mxtics pi
set ytics 3*pi ; set mytics pi
set ztics
set key below
set size 6 square
set grid
plot 3d [-6*pi:6*pi][-6*pi:6*pi][-0.3:1] sinc(hypot(x,y)) \
    with surface col black \
    fillcol hsb(atan2($1,$2)/(2*pi)+0.5,hypot($1,$2)/30+0.2,$3*0.5+0.5)
```

```
