- title: Imagine topic: Imagine, image generator for pandoc . . .

Imagine

Markdown usage

```
Imagine
 A pandoc filter that turns fenced codeblocks into graphics or ascii art by
 wrapping some external command line utilities, such as:
   actdiag, asy, asymptote, blockdiag, boxes, circo, ctioga2, ditaa, dot,
   fdp, figlet, flydraw, gle, gnuplot, graph, graphviz, gri, imagine,
   mermaid, mscgen, neato, nwdiag, octave, packetdiag, pic, pic2plot,
   plantuml, plot, ploticus, protocol, pyxplot, rackdiag, seqdiag, sfdp,
    shebang, twopi
Installation
  1. Put `imagine.py` anywhere along $PATH (pandoc's search path for filters).
 2. % sudo pip install (mandatory):
       - pandocfilters
 3. % sudo apt-get install (1 or more of):
                        http://asymptote.sourceforge.net
       - asymptote,
                        http://boxes.thomasjensen.com
       - boxes,
      - ctioga2,
                        http://ctioga2.sourceforge.net
       - ditaa,
                       http://ditaa.sourceforge.net
       - figlet,
                       http://www.figlet.org
       - flydraw,
                       http://manpages.ubuntu.com/manpages/precise/man1/flydraw.1.html
       - gle-graphics, http://glx.sourceforge.net
       - gnuplot,
                       http://www.gnuplot.info
                       http://graphviz.org
       - graphviz,
       - gri,
                       http://gri.sourceforge.net
       - imagemagick, http://www.imagemagick.org (gri needs `convert`)
       - mscgen,
                       http://www.mcternan.me.uk/mscgen
       - octave,
                       https://www.gnu.org/software/octave
                       http://plantuml.com
       - plantuml,
       - ploticus,
                       http://ploticus.sourceforge.net/doc/welcome.html
       - plotutils,
                       https://www.gnu.org/software/plotutils
       - pyxplot,
                        http://pyxplot.org.uk
     % sudo pip install:
       - blockdiag,
                       http://blockdiag.com
       - phantomjs,
                       http://phantomjs.org/ (for mermaid)
     % git clone
       - protocol,
                        https://github.com/luismartingarcia/protocol.git
     % npm install:

    - -g mermaid, https://knsv.github.io/mermaid (and pip install phantomjs)

Pandoc usage
    % pandoc --filter imagine.py document.md -o document.pdf
```

Imagine takes a Fenced Code Block and runs the associated `cmd` on it:

For most of the commands, the FCB's code is stored in <fname>.cmd and it tries to run the command as shown. Any options are passed on the command line, while an image filename is suggested via <fname>.<fmt>.

<fname> is derived from a hash on the entire FCB, so should be specific to each individual FCB. Any changes to the codeblock or its attributes should lead to new files being created.

- options=".." will be passed onto the command as shown above
 Defaults to ""
- keep=true, will retain the original FCB in an anonymous CodeBlock.
 Defaults to false.
- prog=<other-cmd>, will set the cmd to use.
 Only useful if `cmd` itself is not an appropriate class.

If the command fails and/or produces no image, the FCB is always retained. Any info on stderr is relayed by Imagine, which might be useful for troubleshooting.

Notes:

- subdir `pd-images` is used to store any input/output files
- if an output filename exists, it is not regenerated but simply linked to.
- `packetdiag` & `sfdp`s underlying libraries seem to have some problems.
- when creating a pdf, images are placed `nearest` to their fenced code block
- There's no clean up of files in the temp subdir.

Some commands follow a slightly different pattern:

- `figlet` or `boxes` produce no images, just text on stdout. In these cases, a CodeBlock with stdout is included.
- `plot` takes the code as the filename of the image.meta filename to convert to an image.

Shebang

The Imagine filter also features a `shebang` class for fenced code blocks. In this case, (fenced) code is saved to disk, the executable flag is set and the script is run with the target image filename as its sole argument.

Any output on stdout is added after the image (if any) in a anonymous codeblock. A returncode other than 0 (zero) means the original FCB is retained.

That means that you can use any interpreter and its plotting libraries to create your images and/or plots or simply generate text.

Security

Imagine just hands the fenced code blocks to system commands or simply runs them as system scripts themselves (shebang class). Note that a lot of these plotting tools, implement their own 'little' languages which can create beautiful images but can also do *great* harm.

There is no way to check for 'side effects' in advance, so make sure the fenced code blocks don't do something devious to your system when running them through the Imagine filter.

Imagine command

Finally, a quick way to read this help text again, is to include a fenced codeblock in your markdown document as follows:

```
or on one or more of the commands supported by Imagine:

'imagine
boxes
asy

That's it!
```

Noop's

Only codeblocks with one of Imagine's classes will be recognized and processed.

Anonymous CodeBlock

Anonymous codeblocks are not processed.

This code block is anonymous and not processed by Imagine.

A Python CodeBlock

Neither is a python codeblock processed.

```
if processed_by(Imagine):
    raise Expection('Not ignored by Imagine!')
else:
    print "Great, if you're reading this, it passed through Imagine unharmed"
```

A symptote

ASYMPTOTE a plot

```
=> asy -o <fname>.<fmt> [<options>] <fname>.asy
<= Para(Image)</pre>
```

Notes:

• eps formatted images don't go well together with pandoc.

a plot

```

GRI

Single plot

With the following in ${\tt gri-01.dat}$

```
1 8 11 9
2 22 21 20
3 11 10 9
4 20 15 10

plot the first two columns like so:

'``{.gri imgout="fcb,img" caption="Created by Gri"}
open dta/gri-01.dat
read columns x y
draw curve
draw title "http://gri.sf.net"
```

Multiple curves

```
```{.gri imgout="fcb,img" caption="Created by Gri"}
`draw curves' \xname \y1name ...'`
Draw multiple y columns versus an x column. Assumes
that the datafile is open, and that x is in the first
column, with the y values in one or more following
columns.
```

GRI Multiple curves

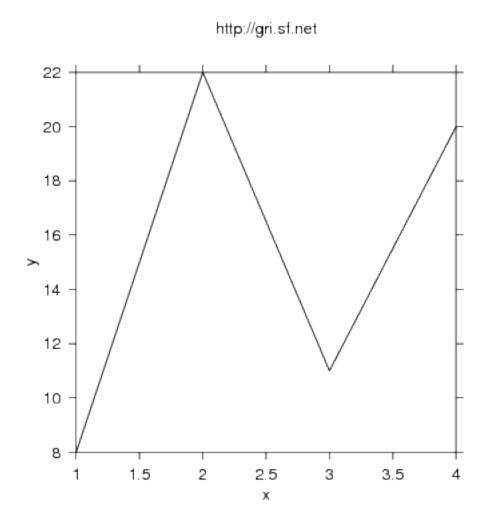

Figure 29: Created by Gri

```
The number of columns is figured out from the options,
as is the name of the x-axis, and the labels to be
used on each of the y curves.
 # NB. the 3 below lets us skip the words 'draw'
 # and 'curves', and the name of the x-column.
 .num of y columns. = {rpn wordc 3 -}
 if {rpn .num_of_y_columns. 1 >}
 show "ERROR: 'draw curves' needs at least 1 y column!"
 quit
 end if
 set x name {rpn 2 wordv}
 set y name ""
 # Loop through the columns.
 .col. = 0
 while {rpn .num_of_y_columns. .col. <}</pre>
 # The x-values will be in column 1, with y-values
 # in columns 2, 3, ..., of the file.
 .ycol. = \{ rpn .col. 2 + \}
 rewind
 read columns x=1 y=.ycol.
 # At this point, you may want to change line thickness,
 # thickness, color, dash-type, etc. For illustration,
 # let's set dash type to the column number.
 set dash .col.
 draw curve
 draw label for last curve {rpn .col. 3 + wordv}
 .col. += 1
 end while
}
open dta/gri-01.dat
draw curves time y1 y2 y3 y4
```

Octave

Hints for using Octave as batch processor:

- ; makes statements silent
- figure(1, "visibility", "off") prevents pop-up window
- print(1, argv(){1}); prints to intended output filename
- octave will infer image type from output filename extension
- imagine calls octave --no-gui -q <options> <inpfile> <outfile>, where
 - <options> come from options=".." in the fenced code blocks attributes
 - <inpfile> is pd-images/hashed-name.octave containing the code text
 - <outfile> is pd-images/hashed-name.png by default

Sinus plot

```

## Plotutils site

### It includes:

- $\bullet~$  GNU graph, which plots 2-D datasets or data streams in real time.
- GNU plot, which translates GNU Metafile format to any of the other formats.
- GNU tek2plot, for translating legacy Tektronix data to any of the above formats.
- GNU pic2plot, for translating the pic language (a scripting language for designing box-and-arrow diagrams) to any of the above formats. The pic language was designed at Bell Labs as an enhancement to the troff text formatter.
- GNU plotfont, for displaying character maps of the fonts that are available in the above formats.
- GNU *spline*, which does spline interpolation of data. It normally uses either cubic spline interpolation or exponential splines in tension, but it can function as a real-time filter under some circumstances.
- GNU ode, which numerically integrates a system consisting of one or more ordinary differential equations.

#### Note:

• Imagine only wraps plot and pic2plot (pic is an alias for pic2plot).

### graph

Each invocation of graph reads one or more datasets from files named on the command line or from standard input, and prepares a plot. There are many command-line options for adjusting the visual

appearance of the plot. The following sections explain how to use the most frequently used options, by giving examples.

```
```{.graph options="-X x-axis -Y y-axis -f 0.1 --bitmap-size 200x200" imgout="fcb,img" caption="PlotUt: 0.0 0.0 1.0 0.2 2.0 0.0 3.0 0.4 4.0 0.2 5.0 0.6
```

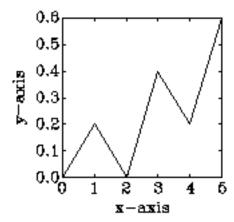

Figure 44: PlotUtil's graph

plot

The GNU plot filter displays GNU graphics metafiles or translates them to other formats. It will take input from files specified on the command line or from standard input. The '-T' option is used to specify the desired output format. Supported output formats include "X", "png", "pnm", "gif", "svg", "ai", "ps", "cgm", "fig", "pcl", "hpgl", "regis", "tek", and "meta" (the default).

The metafile format is a device-independent format for storage of vector graphics. By default, it is a binary rather than a human-readable format (see Metafiles). Each of the graph, pic2plot, tek2plot, and plotfont utilities will write a graphics metafile to standard output if no '-T' option is specified on its command line. The GNU libplot graphics library may also be used to produce metafiles. Metafiles may contain arbitrarily many pages of graphics, but each metafile produced by graph contains only a single page.

plot, like the metafile format itself, is useful if you wish to preserve a vector graphics file, and display or edit it with more than one drawing editor.

```
```{.plot options="--bitmap-size 300x200" imgout="fcb,img" caption="Created by plot"} dta/input.meta
```

### pic2plot

From the gnu website:

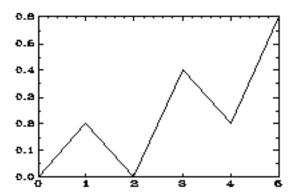

Figure 45: Created by plot

The pic language is a 'little language' that was developed at Bell Laboratories for creating box-and-arrow diagrams of the kind frequently found in technical papers and textbooks. A directory containing documentation on the pic language is distributed along with the plotting utilities. On most systems it is installed as /usr/share/pic2plot or /usr/local/share/pic2plot. The directory includes Brian Kernighan's original technical report on the language, Eric S. Raymond's tutorial on the GNU implementation, and some sample pic macros contributed by the late W. Richard Stevens.

## Protocol:

Protocol is a simple command-line tool that serves two purposes:

- Provide a simple way for engineers to have a look at standard network protocol headers, directly from the command-line, without having to google for the relevant RFC or for ugly header image diagrams.
- Provide a way for researchers and engineers to quickly generate ASCII RFC-like header diagrams for their own custom protocols.

### TCP Header

```
```{.protocol imgout="fcb,img" caption="protocol"}
tcp
```
```

and even custom layouts:

### Customer packet

```
```{.protocol options="--no-numbers" imgout="fcb,img" caption="protocol"}
Source:16,TTL:8,Reserved:40
```

PyxPlot

# SheBang

The imagine filter also features the shebang class which will run the fenced code block as a system script.

```
shebang - <class '__main__.SheBang'>
    ```shebang
    code
    ...
    .. write(code, <fname>.shebang)
    .. chmod u+x <fname>.shebang
```

SHEBANG bash

```
=> <fname>.shebang <fname>.<fmt>
<= Para(Image)</pre>
```

bash

```
```{.shebang imgout="fcb,stdout,img"}
#!/bin/bash
echo "This script is saved as :" $0
echo "and requires boxes to be available"
echo
echo "Its (user) executable flag is set:"
echo
echo (ls - lpah 0 | cut - d' - f1,9) | boxes - d peek
echo
echo "This script won't produce: $1"
echo "But since 'impout'-option above includes a request for img,"
echo "a line is included in the output document, like:"
echo "?? missing ${1}"
echo
echo "If a shebang script returns with an exit code other than 0 (zero)"
echo "the command fails and the original code block is retained"
echo
echo "If imgout=".." includes 'stdout' (like in this case), any text"
echo "on stdout is included in its own CodeBlock"
This script is saved as: pd-images/00f05b20577cf2c54caee25a3b76299c5f324196.shebang
and requires boxes to be available
Its (user) executable flag is set:
 \\/
 (0 \ 0)
 +----000-{_}}-000------
 This script won't produce: pd-images/00f05b20577cf2c54caee25a3b76299c5f324196.png
But since 'impout'-option above includes a request for img,
a line is included in the output document, like:
?? missing pd-images/00f05b20577cf2c54caee25a3b76299c5f324196.png
If a shebang script returns with an exit code other than 0 (zero)
the command fails and the original code block is retained
If imgout=.. includes 'stdout' (like in this case), any text
on stdout is included in its own CodeBlock
```

?? missing pd-images/00f05b20577cf2c54caee25a3b76299c5f324196.png

Octave

Earlier example of Octave, but now run as a script.

```
"``{.shebang imgout="fcb,img" caption="Created by Octave"}
#!/usr/bin/env octave

figure(1, 'visible', 'off');

x = 0:0.01:2*pi;
a = sin(x);
b = cos(2*x);
c = sin(4*x);
d = 2*sin(3*x);
plot(x,a,x,b,x,c,x,d, "linewidth", 2);
set(gca, "xlim", [0,2*pi], "fontsize", 15);
title("sinusoids");

print(1, argv(){1})
```
